You're asking the **right architectural question** — this is exactly how senior engineers use AI effectively.

Let's break this down like an **enterprise-grade workflow** (the way teams at top companies actually do it).

🧠 Big Picture

Creating an **architecture document from existing code using AI (Copilot / ChatGPT agents)** is NOT a single prompt.

👉 It's an **iterative discovery + synthesis loop**

```
Code → Extract → Question → Refine → Structure → Validate → Final Doc
```

🧩 PHASE 1 — Establish Ground Truth (Context Loading)

🎯 Goal:

Give the AI enough signal to understand your system

What you do:

- Provide:
  - repo link OR key folders
  - README (if exists)
  - entry points (`main`, `Program.cs`, etc.)

Prompt example:

```
Analyze this repository and identify:
- system purpose
- entry points
- major modules
- tech stack
```

👉 Output = **rough system map (not final)**

🧩 PHASE 2 — Structural Decomposition (Critical Step)

🎯 Goal:

Break system into **architectural units**

You ask:

```
Break this system into:
- services
- modules
- layers
- data flow boundaries
```

👉 You are NOT asking for doc yet 👉 You are extracting **architecture primitives**

🧠 Iteration behavior here

✅ YES — ask questions ✅ YES — challenge AI ✅ YES — refine

Examples:

- "This looks like a service or just a utility?"
- "Is this tightly coupled or independent?"
- "Where is business logic actually sitting?"

👉 This phase is **interactive discovery**

🧩 PHASE 3 — Deep Dive per Component

Now go module by module:

Prompt pattern:

```
Explain this module:
- responsibility
```

```
- inputs/outputs
- dependencies
- internal flow
```

👉 Do this for:

- API layer
- service layer
- data layer
- infra layer

🔁 Iteration here

You refine like a reviewer:

- "This looks like orchestration, not business logic — confirm"
- "Where is retry logic handled?"
- "Is this synchronous or event-driven?"

👉 You are **guiding AI toward correctness**

🧩 PHASE 4 — System Flow Reconstruction

🎯 Goal:

Understand end-to-end flow

Prompt:

```
Trace a request from entry point to response:
Include all layers, transformations, and side effects
```

👉 This gives:

- sequence understanding
- hidden dependencies
- real architecture (not folder-based illusion)

🧩 PHASE 5 — Architecture Pattern

Identification

Now ask:

```
Identify architecture patterns used:
- layered?
- microservices?
- event-driven?
- CQRS?
- clean architecture?
```

👉 This is where **architect thinking kicks in**

🧩 PHASE 6 — Generate Architecture Document (FIRST DRAFT)

Now give a **template**

✅ Use THIS template (industry-grade)

```
Generate a system architecture document with:

1. Overview
2. System Context
3. High-Level Architecture
4. Component Breakdown
5. Data Flow
6. Key Design Decisions
7. Scalability Considerations
8. Failure Handling
9. Security Considerations
10. Observability
```

👉 Now AI produces draft

🧩 PHASE 7 — Review & Iteration (MOST IMPORTANT)

IMPORTANT)

This is where most people fail.

🔁 Iteration loop

You DO NOT just accept output

You:

- question
- refine
- correct

Types of questions you SHOULD ask

🔍 Clarification

- “This component seems unclear — explain deeper”
- “Where exactly is caching implemented?”

🧠 Architectural correctness

- “This is labeled microservice — but no independent deployability. Correct?”
- “Is this actually layered or just structured folders?”

⚠️ Gaps

- “Where is error handling?”
- “Where is retry / circuit breaker?”
- “What happens on failure?”

📎 Fitment questions (IMPORTANT)

👉 YES — ask these

- “Where does this module fit in overall architecture?”
- “Is this core domain or supporting service?”

- “Is this infra or application layer?”

🧩 PHASE 8 — Refine into FINAL DOC

Now ask:

```
Refine this into a CTO-level architecture document:
- concise
- structured
- decision-oriented
- no fluff
```

🧠 How iteration REALLY works (key insight)

```
AI proposes → You validate → AI corrects → You refine → Repeat
```

👉 AI is NOT source of truth 👉 YOU are the architect

🔥 Golden Prompt Strategy (VERY IMPORTANT)

Instead of vague prompts:

❌ Bad:

```
Explain architecture
```

✅ Good:

```
Map each module to:
- responsibility
- layer (presentation / domain / infra)
- coupling level
- runtime behavior
```

🧠 Advanced Workflow (what top engineers do)

Step 1 — Build Architecture Map

Step 2 — Validate against code

Step 3 — Identify gaps

Step 4 — Improve design

Step 5 — Document

👉 Not just documentation → **design thinking**

💡 Copilot vs ChatGPT usage

GitHub Copilot

- best for:
  - inline understanding
  - code-level explanation

ChatGPT

- best for:
  - system-level reasoning
  - architecture synthesis

👉 Use BOTH together

🚀 Pro-Level Workflow (your level)

```
1. Load repo
2. Extract modules
3. Map architecture
4. Validate assumptions
5. Trace flows
6. Identify patterns
7. Generate doc
8. Critique doc
9. Refine to executive level
```

⚠️ Common Mistakes

❌ Asking for final doc immediately ❌ Not iterating ❌ Blindly trusting AI ❌ Ignoring runtime behavior ❌ Not validating with code

---

🧠 Final Mental Model

You are not “using AI”

👉 You are **running an architecture discovery loop**

🚀 If you want next level

I can:

- give you a **ready-to-use prompt pack (copy-paste)**
- or walk through your Claude repo and **build architecture doc live step-by-step**
- or convert this into a **repeatable enterprise workflow template**

Just tell me 👍

Yes — and this is where most people underperform. There **ARE standard architecture templates**, but top engineers don’t use just one — they combine a few depending on purpose.

I’ll give you **3 industry-grade templates** you can directly use with Copilot/ChatGPT 👇

🧠 1. C4 Model Template (BEST for code →

🧠 1. C4 Model Template (BEST for code / architecture)

👉 Created by Simon Brown 👉 Most widely used for reverse-engineering systems

---

📄 Template

```
# 1. System Context
- What is the system?
- Who uses it?
- External dependencies?

# 2. Container Diagram
- Applications / Services
- Databases
- External systems

# 3. Component Diagram
- Modules inside each service
- Responsibilities

# 4. Code-Level (Optional)
- Key classes
- Interfaces
- Patterns used
```

💡 When to use

✅ Understanding unknown codebase ✅ LLM / microservices / distributed systems ✅ Interview / system design

---

🧠 2. ADR-Based Architecture Template (BEST for senior engineers)

👉 ADR = Architecture Decision Record

📄 Template

```
# 1. Overview
- Purpose
- Scope

# 2. Requirements
- Functional
- Non-functional

# 3. Architecture
- High-level design
- Components

# 4. Key Decisions
- Why this design?
- Alternatives considered

# 5. Trade-offs
- Pros / Cons

# 6. Risks
- Technical risks
- Scaling risks

# 7. Future Improvements
```

💡 When to use

✅ CTO-level docs ✅ Design reviews ✅ Enterprise systems

🧠 3. Runtime Flow + Execution Template (VERY IMPORTANT for AI systems)

👉 This is what most templates MISS 👉 Critical for LLM / agent systems (your case)

📄 Template

```
# 1. Entry Points
- CLI / API / UI

# 2. Request Flow
Step-by-step execution path
```

```
# 3. Control Flow
- Sync vs async
- Orchestration logic

# 4. Data Flow
- Inputs → transformations → outputs

# 5. State Management
- Memory
- Context handling

# 6. External Interactions
- APIs
- Tools
- DB calls

# 7. Failure Handling
- Retries
- Fallbacks
```

💡 When to use

✅ Claude / GPT / agent systems ✅ Distributed workflows ✅ Debugging complex systems

---

🔥 BEST PRACTICE (what you SHOULD do)

👉 Combine all 3:

```
C4 (structure) +
ADR (decisions) +
Runtime Flow (execution)
```

🚀 Ready-to-use MASTER TEMPLATE (copy this)

```
Generate a comprehensive architecture document from this codebase using:

1. System Context (C4)
2. Containers / Services (C4)
3. Components (C4)
```

```
4. Runtime Flow
- Entry points
- Execution flow
- Data flow
- Control flow

5. Architecture Decisions (ADR)
- Key decisions
- Trade-offs
- Alternatives

6. Non-functional aspects
- Scalability
- Reliability
- Security

7. Risks & Gaps
```

🧠 How to use with AI (IMPORTANT)

Step 1 — Give code

Step 2 — Give template

Step 3 — Iterate

Example prompt

```
Analyze this repository and generate an architecture document using the template below.

Focus on:
- real execution flow (not just folder structure)
- actual dependencies
- architectural patterns

[PASTE TEMPLATE]
```

⚠️ Common mistake

❌ “Generate architecture doc” ✅ “Generate architecture doc USING THIS TEMPLATE”

👉 Template = control 👉 No template = hallucination

💡 Pro Tip (your level)

Start with:

1. C4 → understand
2. Runtime → validate
3. ADR → explain

👉 This is exactly how **principal engineers think**

🚀 If you want next level

I can:

- tailor a **custom template for your Claude clone project**
- or generate a **filled architecture doc from your repo**
- or create a **Notion / Confluence-ready version**

Just tell me 👍
